

EasyGSH-DB

3. Stakeholder Workshop „Habitats und Lebensraumtypen“ am 14.11.2019 (BSH)
Variation des Tideniedrig- und mittelwassers im Bereich der Jade und Wesermündung

Analyseergebnisse der Tidekennwerte

Visualisierung der jahreszeitlichen Veränderungen der Tideniedrig- und Tidemittelwasserstände (Tnw / Tmw) im Bereich der Jade/ Wesermündung als 50 %-Quantile

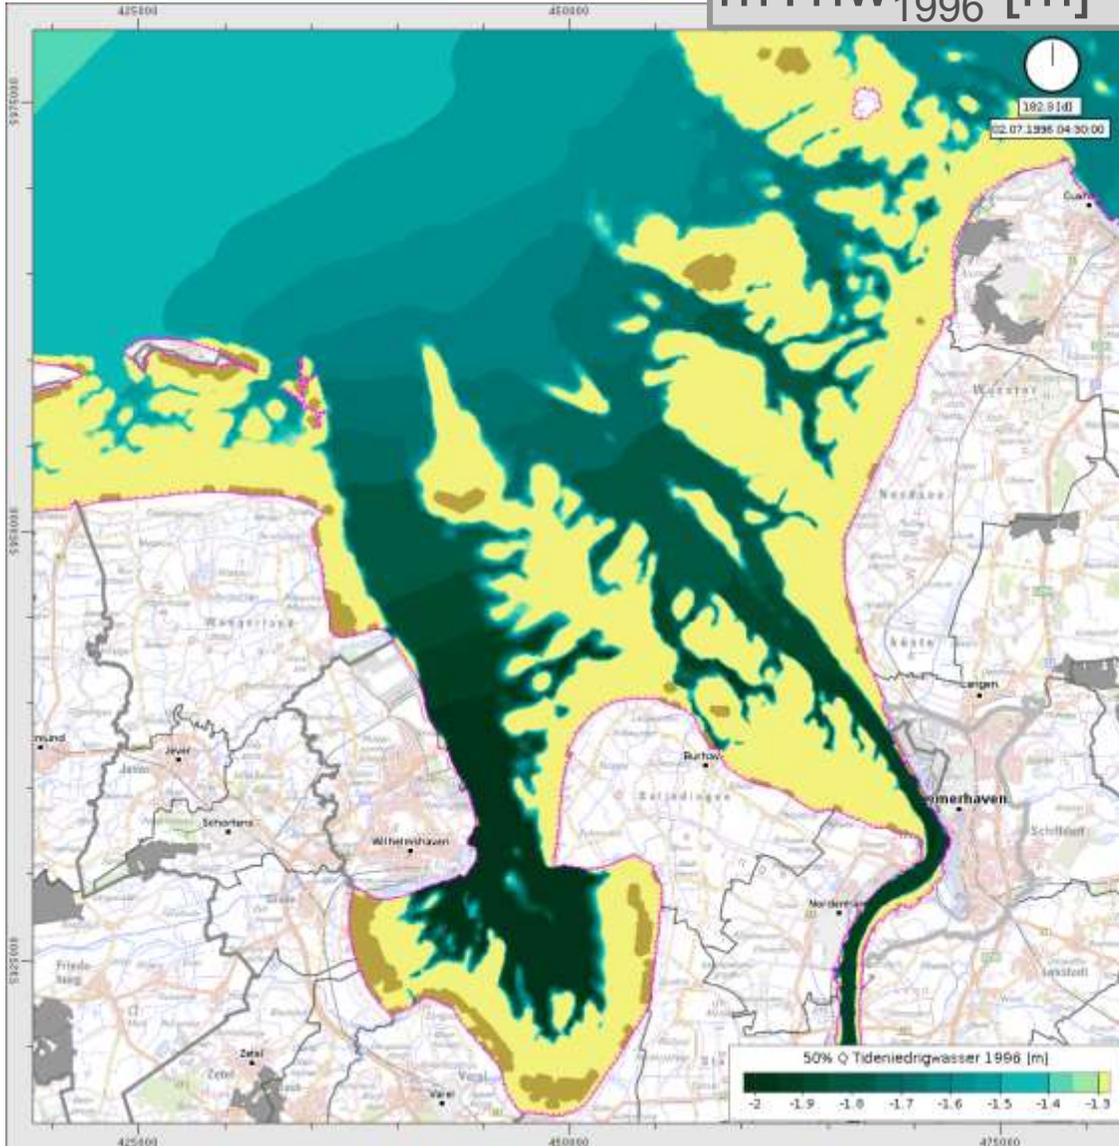

Insbesondere das Tnw reagiert sensitiv auf die orts- und zeitvariablen hydrodynamischen Zustände gekoppelt mit der Veränderung der Bathymetrie (und auch der Bauwerke: Jade-Weser-Port, CTIIIa / CTIV).

Der Einfluss der Meteorologie spiegelt sich in den Analysen im Jedefahrwasser / -busen wieder (Ohne Oberwasser!).

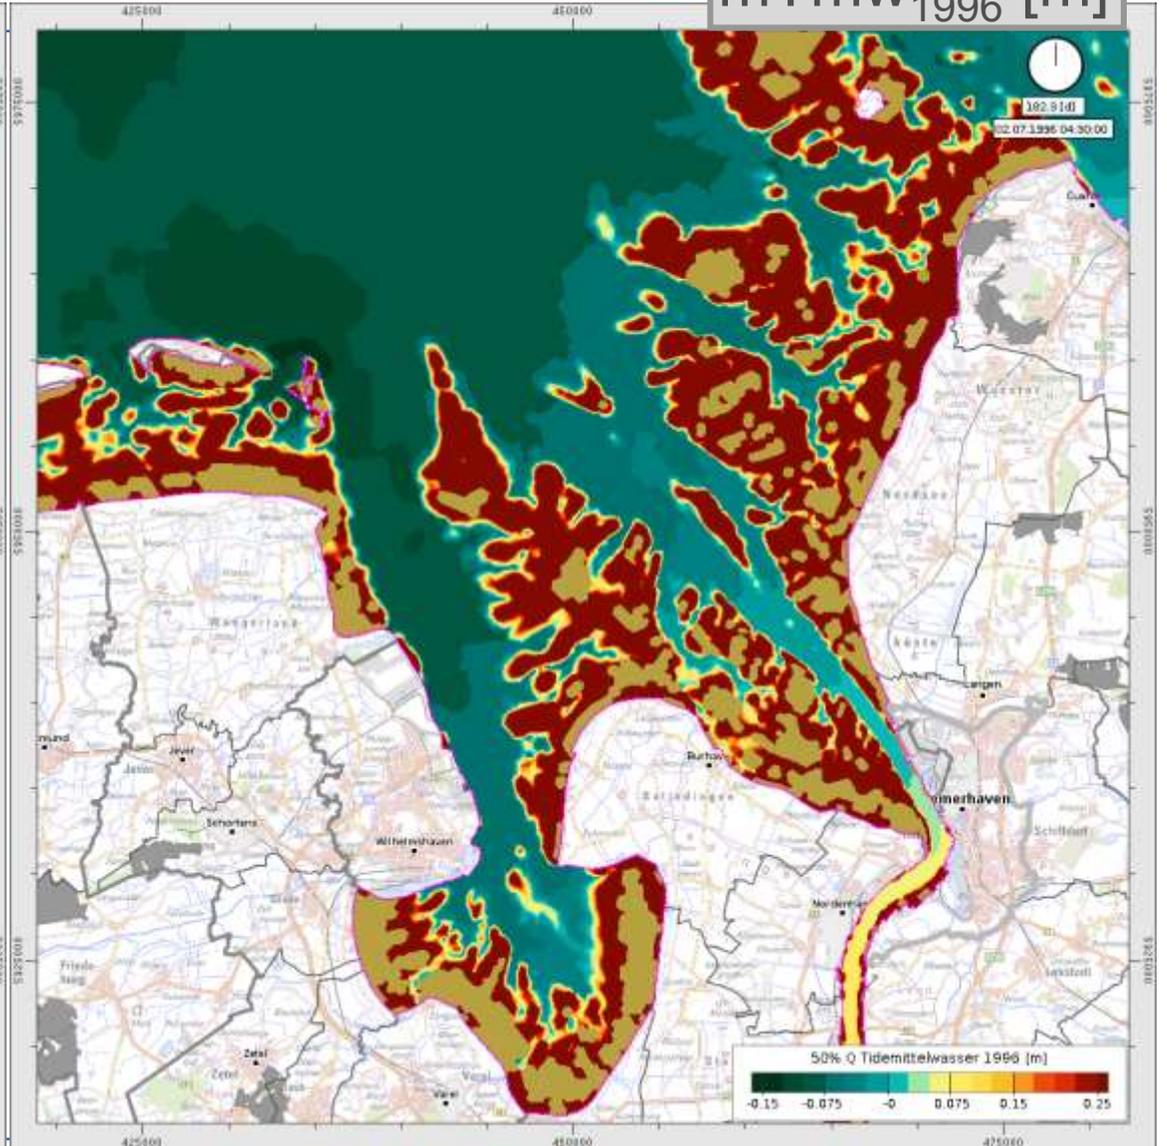

Der Einfluss der jahreszeitlichen Schwankungen des Oberwassers ist in der Wesermündung zu erkennen.

- Analyse der flächenhaften Verteilung des Tnw / Tmw (Jade / Wesermündung)
- für die Jahre
 - 1996
 - 1998 - 2011
 - 2013 - 2014
- es fehlen z. Zt. noch die Jahre
 - 1997
 - 2015
